BIO

Brandon Dean is a Permaculture Designer and Installer in the Pacific Northwest. His company, Healthy Homestead Design, has spent the last decade creating beautiful food forests that help people lead healthy, meaningful lives.

Brandon's passion for health and wellness taught him that our human experience is intricately connected with the health of our ecosystems. He aims to use permaculture principles to design productive landscapes that create an abundant and resilient future for humanity.

SCOPE

Brandon has worked on many scales from small urban lots to 40+ acre farms. His company has installed everything from small raised beds and irrigation systems to large orchards and livestock operations. Healthy Homestead Design covers a wide range but specializes in temperate food forests and unique perennial vegetables. Brandon and his team enjoy creating high-yielding, low-maintenance agricultural systems that enhance the quality of life for the people and wildlife involved.

APPROACH

Our method is a tried and tested three-phase approach that produces a harmonious combination of the client's dreams and the landscapes' offerings.

- Phase 1: Site Assessment and Client Interview: Phase 1 involves a detailed assessment of the constraints and opportunities of the land along with an interview of the client's goals, dreams, and objectives.
- Phase 2: Concept Design: The second phase is where the physical design begins to develop. A plan determines the placement of design components and the functional integration between them.
- Phase 3: Detailed Development: Phase 3 refines the concept plan into clearly defined, actionable strategies along with useful resources for successful implementation.
